

18 – Finite State Machines

Thursday, November 8, 2018 10:03 AM

A finite-state machine (FSM) is an abstract machine that can be in exactly one of a finite number of states at any given time.

The FSM can change from state to another in response to some input. This change is called a transition.

The machine is defined by a list of its states, its initial state and the conditions for each transition.

This information can be represented by a state transition diagram (graph) with nodes as states and directional branches as transitions.

Double outlined circles (nodes) represent accepting states. Single outlined circles (nodes) represent rejecting states.

N.B. the S in S_1 stands for state in these diagrams.

Mealy machines are FSMs with output. In their diagrams, they use the syntax: 'a|b' as labels for each transition to signify that, with an input character of 'a', the output character will be 'b'.

A state transition table is seen below in

Bond Book questions page 403:

1. A) Accept B) Reject C) Reject D) Accept E) Reject F) Accept
2. A) Accept B) Reject C) Accept D) Reject E) Reject F) Reject G) Reject
- 3.

- 4.

5. A) Accept B) Accept C) Accept D) Reject E) Accept F) Accept G) Reject

6.

Current State	S ₀	S ₀	S ₁	S ₁
Input Symbol	a	b	a	b
Next State	S ₁	S ₀	S ₁	S ₀

7.

Current State	S ₀	S ₀	S ₁	S ₁	S ₂	S ₂	S ₃	S ₃
Input Symbol	0	1	0	1	0	1	0	1
Next State	S ₁	S ₃	S ₂	S ₁	S ₂	S ₃	S ₂	S ₃

8. 000100

9. A) 00000000 B) S₀

10.

11. A)=0 B)=1 C)=1 D)=0c1
